After a week holiday it is very gratifying to find every thing working satisfactorily. Transfer Unit has been changed and is now ready to accept and deliver to new store.

Zero test unit almost working.

Interview with TRT this afternoon on very pleasant subject with something of a pep talk on direction of effort

Valve tester

Vibration test with trigger circuits operating alarm if characteristic falls above or below specified standards

Probably the safest method of testing is to apply pulse tests similar to condition prevailing in typical circuits

eg. SP61 tested in input to gate circuit

(a) with pulse applied with failure indicated by lack of output

(b) without pulse applied with failure indicated by presence of output
